

# Criteria Air Pollutants as Toxic Air Pollutants

Gary Palciskco

Toxicologist, Air Quality Program

November 16, 2018

Discussion

# Deriving Acceptable Source Impact Levels

## Toxicity Values

### Cancer Effects

**URF:** Unit Risk Factor

$$ASIL = \frac{\text{target cancer risk}}{URF \times ELAF}$$

### Noncancer Effects

**RfC:** Reference Concentration

ASIL = chronic RfC, REL or MRL

**REL:** Reference Exposure Level

ASIL = intermediate MRL

ASIL = acute MRL

**MRL:** Minimal Risk Level

ASIL = acute REL

## Hierarchy

## Averaging Time

# NAAQS\* & ASILs in 2009

(\*National Ambient Air Quality Standard)

| Pollutant        | Averaging Time  | Level (ug/m3) | Last review | ASIL Averaging Time | Level (ug/m3) |                                      |
|------------------|-----------------|---------------|-------------|---------------------|---------------|--------------------------------------|
| Carbon Monoxide  | 8 hour          | 10,300        | 1994        |                     |               |                                      |
|                  | 1 hour          | 40,100        |             | 1 hour              | 23,000        | Acute REL less than 1 hour NAAQS     |
| Sulfur dioxide   | Annual          | 79            | 1996        |                     |               |                                      |
|                  | 24-hr           | 367           |             |                     |               |                                      |
|                  |                 |               |             | 1 hour              | 660           | No NAAQS for 1 hour duration         |
| Nitrogen dioxide | Annual          | 100           | 1996        |                     |               |                                      |
|                  |                 |               |             | 1 hour              | 470           | No NAAQS for 1 hour duration         |
| Ozone            | 8 hour          | 147           | 1997        |                     |               |                                      |
|                  |                 |               |             | 1 hour              | 180           | No NAAQS for 1 hour duration         |
| Lead             | Rolling 3-month | 0.15          | 2008        | Annual              | 0.083         | Health endpoint based on cancer risk |

# NAAQS in 2018

| Pollutant        | Averaging Time  | Level (ug/m3) | Last review | ASIL Averaging Time | Level (ug/m3) |  |
|------------------|-----------------|---------------|-------------|---------------------|---------------|--|
| Carbon monoxide  | 8 hour          | 10,300        | 2011        |                     |               | No change  |
|                  | 1 hour          | 40,100        |             | 1 hour              | 23,000        |  |
| Sulfur dioxide   | 1 hour          | 196           | 2010        | 1 hour              | 660           | ASIL > NAAQS   |
| Nitrogen dioxide | Annual          | 100           | 2010        |                     |               |  |
|                  | 1 hour          | 188           |             | 1 hour              | 470           | ASIL > NAAQS   |
| Ozone            | 8 hour          | 147           | 2015        |                     |               | NAAQS value lowered, but still only 8-hour averaging time. |
|                  |                 |               |             | 1 hour              | 180           |  |
| Lead             | Rolling 3-month | 0.15          | 2016        | Annual              | 0.083         | No change  |

# De Minimis Comparison

De minimis in WAC 173-460 was set at level comparable to WAC 173-400 (assuming continuous operation)

| Pollutant       | WAC 173-400-110<br>De Minimis | WAC 173-460-150<br>SQER | WAC 173-460-150<br>De Minimis |
|-----------------|-------------------------------|-------------------------|-------------------------------|
| Carbon monoxide | 5 tpy                         | 50.4 lb/hr              | 1.14 lb/hr                    |
| Lead            | 0.005 tpy (10 lbs/yr)         | 16 lb/yr                | 10 lb/yr                      |
| NOx             | 2 tpy                         | 1.03 lb/hr              | 0.457 lb/hr                   |
| Sulfur dioxide  | 2 tpy                         | 1.45 lb/hr              | 0.457 lb/hr                   |
| Ozone           | NA                            | 0.394 lb/hr             | 0.0197 lb/hr                  |

# 2009 Reason for De Minimis Levels for Criteria Pollutants

“As originally proposed, the de minimis values for the above criteria pollutants were far below the de minimis values for those same pollutants in WAC 173-400-110. The effect of this difference would be that most projects with a combustion component would not qualify for the de minimis exemption established in WAC 173-400-110, and would therefore be subject to further regulation. Ecology recognizes the policy rationale behind the de minimis values in WAC 173-400-110, and believes these are more appropriately applied to WAC 173-460 to ensure consistency between the two rule provisions. Ecology therefore applied the existing WAC 173-400-110(5) exemption levels for NO<sub>2</sub>, CO, SO<sub>2</sub>, and lead to their corresponding toxic air pollutant de minimis levels.

The sulfur dioxide value which was originally set with the EPA IRIS value is replaced with the California OEHHA Acute RfC. This is consistent with how the ASILs, SQERs and de minimis values are set for the other criteria pollutants. Ecology believes that replacing the IRIS value with the OEHHA value will improve permitting consistency and remain protective of human health.”
