The rule should:

- Establish more aggressive emission reduction targets consistent with the best available science
- Not allow for carbon offsets to come from sectors that are already covered by the cap, and require more onsite emission reductions that improve local environmental conditions, and
- Protect the integrity of the cap by strengthening the rules that set aside pollution to allow for new growth.

Please complete a robust rule that accomplishes this important step toward a clean energy future.

Thank you!
Mary M. Carr

We are running out of time to maintain a habitable planet and if our earth is to be preserved "into the seventh Generation we must take prompt action to preserve the air we breathe and the water we need to survive. To do this we need to create and enforce clean air rules:

- 1) The rules must be as strong and enforceable as possible to reduce carbon pollution
- 2) Have all possible loopholes eliminated
- 3) Beyond the tools we require to support a strong fight against the climate crisis we are experiencing, Our Legislature must act in concert with our Governor Inslee to achieve these goals.

It has been in many less developed countries where the air is not breathable due to coal pollution and sanitation is so poor that health of all is at risk!! We NOT let that happen to our beautiful state of Washington. Surely we are smarter than that

Thank you,
Darlene A. Townsend Ph.D.
